

## PROPOSAL FROM BPL FOR REVISION TO TABLE 8 (PAGE 47)

The current Table 8 suggests that 22 women declined the first dose and another 28 women declined the second dose.

In TOTAL 28 women declined one or other dose. This conclusion can be drawn from the text of the paragraph which begins:

“MacKenzie *et al.* found...” towards the bottom of page 46.

It would be more accurate and less subject to ambiguity if the table was revised as indicated below:

**Table 8: Reasons for declining RAADP<sup>118</sup>**

Reason for declining	Number of women declining		
	First dose	Second dose	Overall
Partner RhD negative	6	2	8
Last planned pregnancy	3	2	5
Fear of infection	1	0	1
No reason documented	12	2	14
<b>Total</b>	22	6	28

The extra column makes it clear that the total was 28 and comprised 22 who declined the first dose and another 6 who declined the second dose.
